respond self.talkToTurtle() File
"/Users/shaniomallo/CCI/ConvInt_Project_Shani_O-
Mallo/chatbot_thegameofhope_code.py", line 104, in
talkToTurtle turtle_reply =
self.sllm.generate_response(prompt) TypeError:
StandardLLM.generate_response() missing 1 required
positional argument: 'user_input'
```

It's telling you exactly what's wrong:

Your call:

```
turtle_reply = self.sllm.generate_response(prompt)
```

But the method definition for `StandardLLM.generate_response()` requires **two positional arguments**, and you're only giving it one.

The error message says:

```
TypeError: StandardLLM.generate_response() missing 1 required positional a
```

Meaning the function signature probably looks something like:

```
def generate_response(self, system_prompt, user_input): ...
```

or:

```
def generate_response(self, user_input, context): ...
```

✅ How to Fix It

You need to pass **both** required arguments when you call the method.

For example:

```
turtle_reply = self.sllm.generate_response(system_prompt, prompt)
```

or:

```
turtle_reply = self.sllm.generate_response(prompt, user_input)
```

✓ To Give the Correct Fix, I Need One Thing

Please paste **your definition** of:

```
class StandardLLM: def generate_response(...)
```

That way I can tell you exactly what arguments it expects and how to call it correctly.

Want to paste that snippet?
